## Revision History

Date	Rev	Description
August 2004	A-1	Initial release of the AMD Sempron™ Processor Model 10 Data Sheet

## 1 Overview

---

**The AMD Sempron™ processor model 10 with 256K of L2 cache, the new value brand for every-day computing, performs at the top of its class. Using QuantiSpeed™ architecture, this processor is designed to power over 60,000 home and business applications, and it is compatible with various operating systems including Linux and all existing Windows® operating systems.**

The AMD Sempron™ processor model 10 with 256K of L2 cache, based on proven 0.13 micron technology, integrates the innovative design with the manufacturing expertise of AMD. The processor delivers excellent performance and low power, while maximizing system value and maintaining the stable and compatible Socket A infrastructure of the AMD Sempron processor. The 4-digit model(+) numbering system helps identify overall software performance—the higher the number the better the performance. Detailed technical documentation and performance benchmarks are available at [www.amd.com](http://www.amd.com). Visit the AMD Sempron processor product comparison site for more production information.

Delivered in an OPGA package, the AMD Sempron processor model 10 with 256K of L2 cache has full-featured capabilities that deliver the integer, floating-point, and 3D multimedia performance for highly demanding applications running on x86 system platforms. The AMD Sempron processor model 10 with 256K of L2 cache delivers compelling performance for over 60,000 cutting-edge software applications that include:

- high-speed, smooth stream Internet capability
- digital content creation
- digital photo editing and digital video
- image compression
- video encoding for streaming over the Internet
- soft DVD
- commercial 3D modeling
- workstation-class computer-aided design (CAD)
- commercial desktop publishing
- speech recognition

The AMD Sempron processor model 10 with 256K of L2 cache is binary-compatible with existing x86 software and backwards compatible with applications optimized for MMX™, SSE, and 3DNow!™ technology. Using a data format and single-instruction multiple-data (SIMD) operation based on the MMX instruction model, the AMD Sempron processor model 10 can produce as many as four, 32-bit, single-precision floating-point results per clock cycle. The 3DNow! Professional technology implemented in the AMD Sempron processor model 10 with 256K of L2 cache includes integer multimedia instructions and software-directed data movement instructions for optimizing such applications as digital content creation and streaming video for the internet, as well as instructions for digital signal processing (DSP) and communications applications.

The AMD Sempron processor model 10 with 256K of L2 cache features a seventh-generation microarchitecture with an integrated, exclusive L2 cache, which supports the growing processor and system bandwidth requirements of emerging software, graphics, I/O, and memory technologies. The high-speed execution core of the AMD Sempron processor model 10 includes multiple x86 instruction decoders, a dual-ported 128-Kbyte split level-one (L1) cache, an exclusive 256-Kbyte L2 cache, three independent integer pipelines, three address calculation pipelines, and a superscalar, pipelined, out-of-order, three-way floating-point engine. The floating-point engine is capable of delivering top-of-the-class performance on numerically complex applications.

The AMD Sempron processor model 10 with 256K of L2 cache also includes QuantiSpeed™ architecture, a 333-MHz, 2.7-Gigabyte per second AMD Athlon™ system bus, and 3DNow! Professional technology. The AMD Athlon system bus combines the latest technological advances, such as point-to-point topology, source-synchronous packet-based transfers, and low-voltage signaling to provide an extremely powerful, scalable bus for an x86 processor.

## 1.1

## QuantiSpeed™ Architecture Summary

The following design features summarize the QuantiSpeed architecture of the AMD Sempron processor model 10 with 256K of L2 cache:

- A nine-issue, superpipelined, superscalar x86 processor microarchitecture designed for increased instructions per cycle (IPC) and high clock frequencies
- Pipelined floating-point unit that executes all x87 (floating-point), MMX, SSE and 3DNow! instructions
- Hardware data pre-fetch that increases and optimizes performance on high-end software applications utilizing high-bandwidth system capabilities
- Advanced two-level translation look-aside buffer (TLB) structures for both enhanced data and instruction address translation. The AMD Sempron processor model 10 with QuantiSpeed architecture incorporates three TLB optimizations: the L1 DTLB increases from 32 to 40 entries, the L2 ITLB and L2 DTLB both use exclusive architecture, and the TLB entries can be speculatively loaded.

The AMD Sempron processor model 10 delivers excellent system performance in a cost-effective, industry-standard form factor. The AMD Sempron processor model 10 is compatible with motherboards based on Socket A.

Figure 1 on page 4 shows a typical AMD Sempron processor model 10 with 256K L2 cache system block diagram.

**Figure 1. Typical AMD Sempron™ Processor Model 10 System Block Diagram**

## 2 Interface Signals

This section describes the interface signals utilized by the AMD Sempron™ processor model 10.

### 2.1 Overview

The AMD Athlon system bus architecture is designed to deliver excellent data movement bandwidth for next-generation x86 platforms as well as the high-performance required by enterprise-class application software. The system bus architecture consists of three high-speed channels (a unidirectional processor request channel, a unidirectional probe channel, and a 64-bit bidirectional data channel), source-synchronous clocking, and a packet-based protocol. In addition, the system bus supports several control, clock, and legacy signals. The interface signals use an impedance controlled push-pull, low-voltage, swing-signaling technology contained within the Socket A socket.

For more information, see “AMD Athlon™ System Bus Signals” on page 6, Chapter 10, “Pin Descriptions” on page 49, and the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902.

### 2.2 Signaling Technology

The AMD Athlon system bus uses a low-voltage, swing-signaling technology, that has been enhanced to provide larger noise margins, reduced ringing, and variable voltage levels. The signals are push-pull and impedance compensated. The signal inputs use differential receivers that require a reference voltage ( $V_{REF}$ ). The reference signal is used by the receivers to determine if a signal is asserted or deasserted by the source. Termination resistors are not needed because the driver is impedance-matched to the motherboard and a high impedance reflection is used at the receiver to bring the signal past the input threshold.

For more information about pins and signals, see Chapter 10, “Pin Descriptions” on page 49.

## 2.3 Push-Pull (PP) Drivers

The AMD Sempron processor model 10 supports push-pull (PP) drivers. The system logic configures the processor with the configuration parameter called SysPushPull (1=PP). The impedance of the PP drivers is set to match the impedance of the motherboard by two external resistors connected to the ZN and ZP pins.

See “ZN and ZP Pins” on page 75 for more information.

## 2.4 AMD Athlon™ System Bus Signals

The AMD Athlon system bus is a clock-forwarded, point-to-point interface with the following three point-to-point channels:

- A 13-bit unidirectional output address/command channel
- A 13-bit unidirectional input address/command channel
- A 72-bit bidirectional data channel

For more information, see Chapter 6, “333 FSB AMD Sempron™ Processor Model 10 with 256K L2 Cache Specifications” on page 21, Chapter 7, “Electrical Data” on page 25, and the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902.

## 3 Logic Symbol Diagram

Figure 2 is the logic symbol diagram of the processor. This diagram shows the logical grouping of the input and output signals.

Figure 2. Logic Symbol Diagram

## 4 Power Management

This chapter describes the power management control system of the AMD Sempron™ Processor Model 10. The power management features of the processor are compliant with the ACPI 1.0b and ACPI 2.0 specifications.

### 4.1 Power Management States

The AMD Sempron processor model 10 supports low-power Halt and Stop Grant states. These states are used by advanced configuration and power interface (ACPI) enabled operating systems for processor power management.

Figure 3 shows the power management states of the processor. The figure includes the ACPI “Cx” naming convention for these states.

Note: The AMD Athlon™ System Bus is connected during the following states:

- 1) The Probe state
- 2) During transitions between the Halt state and the C2 Stop Grant state
- 3) During transitions between the C2 Stop Grant state and the Halt state
- 4) C0 Working state

**Figure 3. AMD Sempron™ Processor Model 10 Power Management States**

The following sections provide an overview of the power management states. For more details, refer to the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902.

***Note:*** *In all power management states that the processor is powered, the system must not stop the system clock (SYSCLK/SYSCLK#) to the processor.*

**Working State**

The Working state is the state in which the processor is executing instructions.

**Halt State**

When the processor executes the HLT instruction, the processor enters the Halt state and issues a Halt special cycle to the AMD Athlon system bus. The processor only enters the low power state dictated by the CLK\_Ctl MSR if the system controller (Northbridge) disconnects the AMD Athlon system bus in response to the Halt special cycle.

If STPCLK# is asserted, the processor will exit the Halt state and enter the Stop Grant state. The processor will initiate a system bus connect, if it is disconnected, then issue a Stop Grant special cycle. When STPCLK# is deasserted, the processor will exit the Stop Grant state and re-enter the Halt state. The processor will issue a Halt special cycle when re-entering the Halt state.

The Halt state is exited when the processor detects the assertion of INIT#, RESET#, SMI#, or an interrupt via the INTR or NMI pins, or via a local APIC interrupt message. When the Halt state is exited, the processor will initiate an AMD Athlon system bus connect if it is disconnected.

**Stop Grant States**

The processor enters the Stop Grant state upon recognition of assertion of STPCLK# input. After entering the Stop Grant state, the processor issues a Stop Grant special bus cycle on the AMD Athlon system bus. The processor is not in a low-power state at this time, because the AMD Athlon system bus is still connected. After the Northbridge disconnects the AMD Athlon system bus in response to the Stop Grant special bus cycle, the processor enters a low-power state dictated by the CLK\_Ctl MSR. If the Northbridge needs to probe the processor during the Stop Grant state while the system bus is disconnected, it

must first connect the system bus. Connecting the system bus places the processor into the higher power probe state. After the Northbridge has completed all probes of the processor, the Northbridge must disconnect the AMD Athlon system bus again so that the processor can return to the low-power state. During the Stop Grant states, the processor latches INIT#, INTR, NMI, SMI#, or a local APIC interrupt message, if they are asserted.

The Stop Grant state is exited upon the deassertion of STPCLK# or the assertion of RESET#. When STPCLK# is deasserted, the processor initiates a connect of the AMD Athlon system bus if it is disconnected. After the processor enters the Working state, any pending interrupts are recognized and serviced and the processor resumes execution at the instruction boundary where STPCLK# was initially recognized. If RESET# is sampled asserted during the Stop Grant state, the processor exits the Stop Grant state and the reset process begins.

There are two mechanisms for asserting STPCLK#—hardware and software.

The Southbridge can force STPCLK# assertion for throttling to protect the processor from exceeding its maximum case temperature. This is accomplished by asserting the THERM# input to the Southbridge. Throttling asserts STPCLK# for a percentage of a predefined throttling period: STPCLK# is repetitively asserted and deasserted until THERM# is deasserted.

Software can force the processor into the Stop Grant state by accessing ACPI-defined registers typically located in the Southbridge.

The operating system places the processor into the C2 Stop Grant state by reading the P\_LVL2 register in the Southbridge.

If an ACPI Thermal Zone is defined for the processor, the operating system can initiate throttling with STPCLK# using the ACPI defined P\_CNT register in the Southbridge. The Northbridge connects the AMD Athlon system bus, and the processor enters the Probe state to service cache snoops during Stop Grant for C2 or throttling.

In C2, probes are allowed, as shown in Figure 3 on page 9

The Stop Grant state is also entered for the S1, Powered On Suspend, system sleep state based on a write to the SLP\_TYP and SLP\_EN fields in the ACPI-defined Power Management 1 control register in the Southbridge. During the S1 Sleep state, system software ensures no bus master or probe activity occurs. The Southbridge deasserts STPCLK# and brings the processor out of the S1 Stop Grant state when any enabled resume event occurs.

#### **Probe State**

The Probe state is entered when the Northbridge connects the AMD Athlon system bus to probe the processor (for example, to snoop the processor caches) when the processor is in the Halt or Stop Grant state. When in the Probe state, the processor responds to a probe cycle in the same manner as when it is in the Working state. When the probe has been serviced, the processor returns to the same state as when it entered the Probe state (Halt or Stop Grant state). When probe activity is completed the processor only returns to a low-power state after the Northbridge disconnects the AMD Athlon system bus again.

## **4.2**

### **Connect and Disconnect Protocol**

Significant power savings of the processor only occur if the processor is disconnected from the system bus by the Northbridge while in the Halt or Stop Grant state. The Northbridge can optionally initiate a bus disconnect upon the receipt of a Halt or Stop Grant special cycle. The option of disconnecting is controlled by an enable bit in the Northbridge. If the Northbridge requires the processor to service a probe after the system bus has been disconnected, it must first initiate a system bus connect.

#### **Connect Protocol**

In addition to the legacy STPCLK# signal and the Halt and Stop Grant special cycles, the AMD Athlon system bus connect protocol includes the CONNECT, PROCRDY, and CLKFWDRST signals and a Connect special cycle.

AMD Athlon system bus disconnects are initiated by the Northbridge in response to the receipt of a Halt or Stop Grant. Reconnect is initiated by the processor in response to an

interrupt for Halt or STPCLK# deassertion. Reconnect is initiated by the Northbridge to probe the processor.

The Northbridge contains BIOS programmable registers to enable the system bus disconnect in response to Halt and Stop Grant special cycles. When the Northbridge receives the Halt or Stop Grant special cycle from the processor and, if there are no outstanding probes or data movements, the Northbridge deasserts CONNECT a minimum of eight SYSCLK periods after the last command sent to the processor. The processor detects the deassertion of CONNECT on a rising edge of SYSCLK and deasserts PROCRDY to the Northbridge. In return, the Northbridge asserts CLKFWDRST in anticipation of reestablishing a connection at some later point.

**Note:** *The Northbridge must disconnect the processor from the AMD Athlon system bus before issuing the Stop Grant special cycle to the PCI bus or passing the Stop Grant special cycle to the Southbridge for systems that connect to the Southbridge with HyperTransport™ technology.*

*This note applies to current chipset implementation—alternate chipset implementations that do not require this are possible.*

**Note:** *In response to Halt special cycles, the Northbridge passes the Halt special cycle to the PCI bus or Southbridge immediately.*

The processor can receive an interrupt after it sends a Halt special cycle, or STPCLK# deassertion after it sends a Stop Grant special cycle to the Northbridge but before the disconnect actually occurs. In this case, the processor sends the Connect special cycle to the Northbridge, rather than continuing with the disconnect sequence. In response to the Connect special cycle, the Northbridge cancels the disconnect request.

The system is required to assert the CONNECT signal before returning the C-bit for the connect special cycle (assuming CONNECT has been deasserted).

For more information, see the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902 for the definition of the C-bit and the Connect special cycle.

Figure 4 shows STPCLK# assertion resulting in the processor in the Stop Grant state and the AMD Athlon system bus disconnected.

**Figure 4. AMD Athlon™ System Bus Disconnect Sequence in the Stop Grant State**

An example of the AMD Athlon system bus disconnect sequence is as follows:

1. The peripheral controller (Southbridge) asserts STPCLK# to place the processor in the Stop Grant state.
2. When the processor recognizes STPCLK# asserted, it enters the Stop Grant state and then issues a Stop Grant special cycle.
3. When the special cycle is received by the Northbridge, it deasserts CONNECT, assuming no probes are pending, initiating a bus disconnect to the processor.
4. The processor responds to the Northbridge by deasserting PROCRDY.
5. The Northbridge asserts CLKFWDRST to complete the bus disconnect sequence.
6. After the processor is disconnected from the bus, the processor enters a low-power state. The Northbridge passes the Stop Grant special cycle along to the Southbridge.

Figure 5 shows the signal sequence of events that takes the processor out of the Stop Grant state, connects the processor to the AMD Athlon system bus, and puts the processor into the Working state.

**Figure 5. Exiting the Stop Grant State and Bus Connect Sequence**

The following sequence of events removes the processor from the Stop Grant state and connects it to the system bus:

1. The Southbridge deasserts STPCLK#, informing the processor of a wake event.
2. When the processor recognizes STPCLK# deassertion, it exits the low-power state and asserts PROCRDY, notifying the Northbridge to connect to the bus.
3. The Northbridge asserts CONNECT.
4. The Northbridge deasserts CLKFWDRST, synchronizing the forwarded clocks between the processor and the Northbridge.
5. The processor issues a Connect special cycle on the system bus and resumes operating system and application code execution.

## Connect State Diagram

Figure 6 below and Figure 7 on page 17 show the Northbridge and processor connect state diagrams, respectively.

Condition	
1	A disconnect is requested and probes are still pending.
2	A disconnect is requested and no probes are pending.
3	A Connect special cycle from the processor.
4	No probes are pending.
5	PROCRDY is deasserted.
6	A probe needs service.
7	PROCRDY is asserted.
8	Three SYSCLK periods after CLKFWDRST is deasserted. <i>Although reconnected to the system interface, the Northbridge must not issue any non-NOP SysDC commands for a minimum of four SYSCLK periods after deasserting CLKFWDRST.</i>

Action	
A	Deassert CONNECT eight SYSCLK periods after last SysDC sent.
B	Assert CLKFWDRST.
C	Assert CONNECT.
D	Deassert CLKFWDRST.

Figure 6. Northbridge Connect State Diagram

	Condition	Action
1	CONNECT is deasserted by the Northbridge (for a previously sent Halt or Stop Grant special cycle).	A CLKFWDRST is asserted by the Northbridge.
2	Processor receives a wake-up event and must cancel the disconnect request.	B Issue a Connect special cycle.*
3	Deassert PROCRDY and slow down internal clocks.	C Return internal clocks to full speed and assert PROCRDY.
4	Processor wake-up event or CONNECT asserted by Northbridge.	
5	CLKFWDRST is deasserted by the Northbridge.	
6	Forward clocks start three SYSCLK periods after CLKFWDRST is deasserted.	

**Note:**

\* The Connect special cycle is only issued after a processor wake-up event (interrupt or STPCLK# deassertion) occurs. If the AMD Athlon™ system bus is connected so the Northbridge can probe the processor, a Connect special cycle is not issued at that time (it is only issued after a subsequent processor wake-up event).

Figure 7. Processor Connect State Diagram

**4.3****Clock Control**

The processor implements a Clock Control (CLK\_Ctl) MSR (address C001\_001Bh) that determines the internal clock divisor when the AMD Athlon system bus is disconnected.

Refer to the *AMD Athlon™ and AMD Duron™ Processors BIOS, Software, and Debug Developers Guide*, order# 21656, for more details on the CLK\_Ctl register.

## 5 CPUID Support

---

AMD Sempron™ processor model 10 version and feature set recognition can be performed through the use of the CPUID instruction, that provides complete information about the processor—vendor, type, name, etc., and its capabilities. Software can make use of this information to accurately tune the system for maximum performance and benefit to users.

For information on the use of the CPUID instruction see the following document:

- *AMD Processor Recognition Application Note*, order# 20734

## 6 333 FSB AMD Sempron™ Processor Model 10 with 256K L2 Cache Specifications

This chapter describes the electrical specifications that are unique to the advanced 333 front-side bus (FSB) AMD Sempron™ Processor Model 10 with 256K L2 cache.

### 6.1 Electrical and Thermal Specifications for the AMD Sempron™ Processor Model 10 with 256K L2 Cache

Table 1 shows the electrical and thermal specifications in the C0 working state and the S1 Stop Grant state for this processor.

**Table 1. Electrical and Thermal Specifications for the AMD Sempron™ Processor Model 10 with 256K L2 Cache**

Frequency in MHz (Model Number)	V <sub>CC_CORE</sub> (Core Voltage)	I <sub>CC</sub> (Processor Current)				Thermal Power <sup>5</sup>		Maximum Die Temperature	
		Working State C0		Stop Grant S1 <sup>1, 2, 3, 4</sup>					
		Maximum	Typical	Maximum	Typical	Maximum	Typical		
1500 (2200+)	1.60 V	38.75 A	30.9 A	8.10 A	4.94 A	62.0 W	49.4 W	90°C	
2000 (2800+)									

**Notes:**

1. See Figure 3, "AMD Sempron™ Processor Model 10 Power Management States" on page 9.
2. The maximum Stop Grant currents are absolute worst case currents for parts that may yield from the worst case corner of the process and are not representative of the typical Stop Grant current that is currently about one-third of the maximum specified current.
3. These currents occur when the AMD Athlon™ system bus is disconnected and has a low power ratio of 1/8 for Stop Grant disconnect and a low power ratio of 1/8 Halt disconnect applied to the core clock grid of the processor as dictated by a value of 2003\_1223h programmed into the Clock Control (CLK\_Ctl) MSR. For more information, refer to the AMD Athlon™ and AMD Duron™ Processors BIOS, Software, and Debug Developers Guide, order# 21656.
4. The Stop Grant current consumption is characterized at 50°C and not tested.
5. Thermal design power represents the maximum sustained power dissipated while executing publicly-available software or instruction sequences under normal system operation at nominal V<sub>CC\_CORE</sub>. Thermal solutions must monitor the temperature of the processor to prevent the processor from exceeding its maximum die temperature.

## 6.2

## 333 FSB AMD Sempron™ Processor Model 10 SYSCLK and SYSCLK# AC Characteristics

Table 2 shows the SYSCLK/SYSCLK# differential clock AC characteristics of this processor.

**Table 2. 333 FSB SYSCLK and SYSCLK# AC Characteristics**

Symbol	Parameter Description	Minimum	Maximum	Units	Notes
	Clock Frequency	50	166	MHz	1
	Duty Cycle	30%	70%		
$t_1$	Period	6		ns	2, 3
$t_2$	High Time	1.0		ns	
$t_3$	Low Time	1.0		ns	
$t_4$	Fall Time		2	ns	
$t_5$	Rise Time		2	ns	
	Period Stability		$\pm 300$	ps	

**Notes:**

1. The AMD Athlon™ system bus operates at twice this clock frequency.
2. Circuitry driving the AMD Athlon system bus clock inputs must exhibit a suitably low closed-loop jitter bandwidth to allow the PLL to track the jitter. The -20dB attenuation point, as measured into a 20- or 30-pF load must be less than 500 kHz.
3. Circuitry driving the AMD Athlon system bus clock inputs may purposely alter the AMD Athlon system bus clock frequency (spread spectrum clock generators). In no cases can the AMD Athlon system bus period violate the minimum specification above. AMD Athlon system bus clock inputs can vary from 100% of the specified frequency to 99% of the specified frequency at a maximum rate of 100 kHz.

Figure 8 shows a sample waveform of the SYSCLK signal.

**Figure 8. SYSCLK Waveform**

## 6.3 333 FSB AMD Athlon™ System Bus AC Characteristics

The AC characteristics of the AMD Athlon system bus of this processor are shown in Table 3. The parameters are grouped based on the source or destination of the signals involved.

**Table 3. 333 FSB AMD Athlon™ System Bus AC Characteristics**

Group	Symbol	Parameter	Min	Max	Units	Notes
All Signals	$T_{RISE}$	Output Rise Slew Rate	1	3	V/ns	1
	$T_{FALL}$	Output Fall Slew Rate	1	3	V/ns	1
Forward Clocks	$T_{SKEW-DIFFEDGE}$	Output skew with respect to a different clock edge	–	770	ps	2
	$T_{SU}$	Input Data Setup Time	300		ps	3
	$T_{HD}$	Input Data Hold Time	300		ps	3
	$C_{IN}$	Capacitance on input clocks	4	25	pF	
	$C_{OUT}$	Capacitance on output clocks	4	12	pF	
Sync	$T_{VAL}$	RSTCLK to Output Valid	800	2000	ps	4, 5
	$T_{SU}$	Setup to RSTCLK	500		ps	4, 6
	$T_{HD}$	Hold from RSTCLK	500		ps	4, 6

**Notes:**

1. Rise and fall time ranges are guidelines over which the I/O has been characterized.
2.  $T_{SKEW-DIFFEDGE}$  is the maximum skew within a clock forwarded group between any two signals or between any signal and its forward clock, as measured at the package, with respect to different clock edges.
3. Input SU and HD times are with respect to the appropriate Clock Forward Group input clock.
4. The synchronous signals include PROCRDY, CONNECT, and CLKFWDRST.
5.  $T_{VAL}$  is RSTCLK rising edge to output valid for PROCRDY. Test Load is 25 pF.
6.  $T_{SU}$  is setup of CONNECT/CLKFWDRST to rising edge of RSTCLK.  $T_{HD}$  is hold of CONNECT/CLKFWDRST from rising edge of RSTCLK.

## 6.4 333 FSB AMD Athlon™ System Bus DC Characteristics

Table 4 shows the DC characteristics of the AMD Athlon system bus for this processor.

**Table 4. 333 FSB AMD Athlon™ System Bus DC Characteristics**

Symbol	Parameter	Condition	Min	Max	Units	Notes
$V_{REF}$	DC Input Reference Voltage		$(0.5 \times V_{CC\_CORE}) -50$	$(0.5 \times V_{CC\_CORE}) +50$	mV	1
$I_{VREF\_LEAK\_P}$	$V_{REF}$ Tristate Leakage Pullup	$V_{IN} = V_{REF}$ Nominal	-100		$\mu A$	
$I_{VREF\_LEAK\_N}$	$V_{REF}$ Tristate Leakage Pulldown	$V_{IN} = V_{REF}$ Nominal		100	$\mu A$	
$V_{IH}$	Input High Voltage		$V_{REF} +200$	$V_{CC\_CORE} +500$	mV	
$V_{IL}$	Input Low Voltage		-500	$V_{REF} -200$	mV	
$I_{LEAK\_P}$	Tristate Leakage Pullup	$V_{IN} = VSS$ (Ground)	-1		mA	
$I_{LEAK\_N}$	Tristate Leakage Pulldown	$V_{IN} = V_{CC\_CORE}$ Nominal		1	mA	
$C_{IN}$	Input Pin Capacitance		4	7	pF	
$R_{ON}$	Output Resistance		$0.90 \times R_{setN,P}$	$1.1 \times R_{setN,P}$	$\Omega$	2
$R_{setP}$	Impedance Set Point, P Channel		40	70	$\Omega$	2
$R_{setN}$	Impedance Set Point, N Channel		40	70	$\Omega$	2
<b>Notes:</b>						
1. $V_{REF}$ is nominally set to 50% of $V_{CC\_CORE}$ with actual values that are specific to motherboard design implementation. $V_{REF}$ must be created with a sufficiently accurate DC source and a sufficiently quiet AC response to adhere to the $\pm 50$ mV specification listed above.						
2. Measured at $V_{CC\_CORE} / 2$ .						

## 7 Electrical Data

This chapter describes the electrical characteristics that apply to all desktop AMD Sempron™ processors model 10 with 256K L2 cache.

### 7.1 Conventions

The conventions used in this chapter are as follows:

- Current specified as being sourced by the processor is *negative*.
- Current specified as being sunk by the processor is *positive*.

### 7.2 Interface Signal Groupings

The electrical data in this chapter is presented separately for each signal group.

Table 5 defines each group and the signals contained in each group.

**Table 5. Interface Signal Groupings**

Signal Group	Signals	Notes
Power	VID[4:0], VCCA, V <sub>CC_CORE</sub> , COREFB, COREFB#	See "Voltage Identification (VID[4:0])" on page 26, "VID[4:0] Pins" on page 74, "VCCA AC and DC Characteristics" on page 27, "V <sub>CC_CORE</sub> Characteristics" on page 28, "VCCA Pin" on page 73, and "COREFB and COREFB# Pins" on page 69.
Frequency	FID[3:0]	See "Frequency Identification (FID[3:0])" on page 27 and "FID[3:0] Pins" on page 70.
System Clocks	SYSCLK, SYSCLK# (Tied to CLKIN/CLKIN# and RSTCLK/RSTCLK#), PLLBYPASSCLK#, PLLBYPASSCLK	See Table 11, "SYSCLK and SYSCLK# DC Characteristics," on page 31, Table 3, "333 FSB AMD Athlon™ System Bus AC Characteristics," on page 23, "SYSCLK and SYSCLK#" on page 73, and "PLL Bypass and Test Pins" on page 72.
AMD Athlon™ System Bus	SADDIN[14:2]#, SADDOUT[14:2]#, SADDINCLK#, SADDOUTCLK#, SFILLVAL#, SDATAINVAL#, SDATAOUTVAL#, SDATA[63:0]#, SDATAINCLK[3:0]#, SDATAOUTCLK[3:0]#, CLKFWDRST, PROCRDY, CONNECT	See "333 FSB AMD Sempron™ Processor Model 10 with 256K L2 Cache Specifications" on page 21, Table 3, "333 FSB AMD Athlon™ System Bus AC Characteristics," on page 23, Table 4, "333 FSB AMD Athlon™ System Bus DC Characteristics," on page 24, and "CLKFWDRST Pin" on page 68.

**Table 5. Interface Signal Groupings (continued)**

Signal Group	Signals	Notes
Southbridge	RESET#, INTR, NMI, SMI#, INIT#, A20M#, FERR, IGNNE#, STPCLK#, FLUSH#	See “General AC and DC Characteristics” on page 32, “INTR Pin” on page 72, “NMI Pin” on page 72, “SMI# Pin” on page 73, “INIT# Pin” on page 71, “A20M# Pin” on page 68, “FERR Pin” on page 69, “IGNNE# Pin” on page 71, “STPCLK# Pin” on page 73, and “FLUSH# Pin” on page 71.
JTAG	TMS, TCK, TRST#, TDI, TDO	See “General AC and DC Characteristics” on page 32.
Test	PLLBYPASS#, PLLTEST#, PLLMON1, PLLMON2, SCANCLK1, SCANCLK2, SCANSHIFTEN, SCANINTEVAL, ANALOG	See “General AC and DC Characteristics” on page 32, “PLL Bypass and Test Pins” on page 72, “Scan Pins” on page 73, “Analog Pin” on page 68.
Miscellaneous	DBREQ#, DBRDY, PWROK	See “General AC and DC Characteristics” on page 32, “DBRDY and DBREQ# Pins” on page 69, “PWROK Pin” on page 73.
APIC	PICD[1:0]#, PICCLK	See “APIC Pins AC and DC Characteristics” on page 37, and “APIC Pins, PICCLK, PICD[1:0]#” on page 68.
Thermal	THERMDA, THERMDC	See Table 13, “Thermal Diode Electrical Characteristics,” on page 35, and “THERMDA and THERMDC Pins” on page 73.

### 7.3 Voltage Identification (VID[4:0])

Table 6 shows the VID[4:0] DC Characteristics. For more information on VID[4:0] DC Characteristics, see “VID[4:0] Pins” on page 74.

**Table 6. VID[4:0] DC Characteristics**

Parameter	Description	Min	Max
I <sub>OL</sub>	Output Current Low	6 mA	
V <sub>OH</sub>	Output High Voltage	–	5.25 V *
<b>Note:</b>			
* The VID pins are either open circuit or pulled to ground. It is recommended that these pins are not pulled above 5.25 V, which is 5.0 V + 5%.			

## 7.4 Frequency Identification (FID[3:0])

Table 7 shows the FID[3:0] DC characteristics. For more information, see “FID[3:0] Pins” on page 70.

**Table 7. FID[3:0] DC Characteristics**

Parameter	Description	Min	Max
$I_{OL}$	Output Current Low	6 mA	
$V_{OH}$	Output High Voltage	-	2.625 V <sup>1</sup>
			$ V_{OH} - V_{CC\_CORE}  \leq 1.60 \text{ V}^2$

**Note:**

1. The FID pins must not be pulled above 2.625 V, which is equal to 2.5 V plus a maximum of five percent.
2. Refer to “VCC\_2.5V Generation Circuit” found in the section, “Motherboard Required Circuits,” of the AMD Athlon™ Processor-Based Motherboard Design Guide, order# 24363.

## 7.5 VCCA AC and DC Characteristics

Table 8 shows the AC and DC characteristics for VCCA. For more information, see “VCCA Pin” on page 73.

**Table 8. VCCA AC and DC Characteristics**

Symbol	Parameter	Min	Nominal	Max	Units	Notes
$V_{VCCA}$	VCCA Pin Voltage	2.25	2.5	2.75	V	1
				$ V_{VCCA} - V_{CC\_CORE}  \leq 1.60 \text{ V}$	-	2
$I_{VCCA}$	VCCA Pin Current	0		50	mA/GHz	3

**Notes:**

1. Minimum and Maximum voltages are absolute. No transients below minimum nor above maximum voltages are permitted.
2. For more information, refer to the AMD Athlon™ Processor-Based Motherboard Design Guide, order# 24363.
3. Measured at 2.5 V.

## 7.6 Decoupling

See the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, or contact your local AMD office for information about the decoupling required on the motherboard for use with the AMD Sempron processor model 10.

## 7.7 $V_{CC\_CORE}$ Characteristics

Table 9 shows the AC and DC characteristics for  $V_{CC\_CORE}$ . See Figure 9 on page 29 for a graphical representation of the  $V_{CC\_CORE}$  waveform.

**Table 9.  $V_{CC\_CORE}$  AC and DC Characteristics**

Symbol	Parameter	Limit in Working State	Units
$V_{CC\_CORE\_DC\_MAX}$	Maximum static voltage above $V_{CC\_CORE\_NOM}$ <sup>*</sup>	50	mV
$V_{CC\_CORE\_DC\_MIN}$	Maximum static voltage below $V_{CC\_CORE\_NOM}$ <sup>*</sup>	-50	mV
$V_{CC\_CORE\_AC\_MAX}$	Maximum excursion above $V_{CC\_CORE\_NOM}$ <sup>*</sup>	150	mV
$V_{CC\_CORE\_AC\_MIN}$	Maximum excursion below $V_{CC\_CORE\_NOM}$ <sup>*</sup>	-100	mV
$t_{MAX\_AC}$	Maximum excursion time for AC transients	10	$\mu$ s
$t_{MIN\_AC}$	Negative excursion time for AC transients	5	$\mu$ s

**Note:**

*\* All voltage measurements are taken differentially at the COREFB/COREFB# pins.*

Figure 9 shows the processor core voltage ( $V_{CC\_CORE}$ ) waveform response to perturbation. The  $t_{MIN\_AC}$  (negative AC transient excursion time) and  $t_{MAX\_AC}$  (positive AC transient excursion time) represent the maximum allowable time below or above the DC tolerance thresholds.

**Figure 9.  $V_{CC\_CORE}$  Voltage Waveform**

**7.8****Absolute Ratings**

The AMD Sempron processor model 10 should not be subjected to conditions exceeding the absolute ratings, as such conditions can adversely affect long-term reliability or result in functional damage.

Table 10 lists the maximum absolute ratings of operation for the AMD Sempron processor model 10.

**Table 10. Absolute Ratings**

Parameter	Description	Min	Max
$V_{CC\_CORE}$	Processor core voltage supply	-0.5 V	$V_{CC\_CORE} \text{ Max} + 0.5 \text{ V}$
VCCA	Processor PLL voltage supply	-0.5 V	VCCA Max + 0.5 V
$V_{PIN}$	Voltage on any signal pin	-0.5 V	$V_{CC\_CORE} \text{ Max} + 0.5 \text{ V}$
$T_{STORAGE}$	Storage temperature of processor	-40°C	100°C

## 7.9 SYSCLK and SYSCLK# DC Characteristics

Table 11 shows the DC characteristics of the SYSCLK and SYSCLK# differential clocks. The SYSCLK signal represents CLKIN and RSTCLK tied together while the SYSCLK# signal represents CLKIN# and RSTCLK# tied together. For more information about SYSCLK and SYSCLK#, see “SYSCLK and SYSCLK#” on page 73 and Table 19, “Pin Name Abbreviations,” on page 52.

**Table 11. SYSCLK and SYSCLK# DC Characteristics**

Symbol	Description	Min	Max	Units
$V_{\text{Threshold-DC}}$	Crossing before transition is detected (DC)	400		mV
$V_{\text{Threshold-AC}}$	Crossing before transition is detected (AC)	450		mV
$I_{\text{LEAK\_P}}$	Leakage current through P-channel pullup to $V_{\text{CC\_CORE}}$	-1		mA
$I_{\text{LEAK\_N}}$	Leakage current through N-channel pulldown to VSS (Ground)		1	mA
$V_{\text{CROSS}}$	Differential signal crossover		$\frac{V_{\text{CC\_CORE}}}{2} \pm 100$	mV
$C_{\text{PIN}}$	Capacitance *	4	25 *	pF

**Note:**

\* The following processor inputs have twice the listed capacitance because they connect to two input pads—SYSCLK and SYSCLK#. SYSCLK connects to CLKIN/RSTCLK. SYSCLK# connects to CLKIN#/RSTCLK#.

Figure 10 shows the DC characteristics of the SYSCLK and SYSCLK# signals.

**Figure 10. SYSCLK and SYSCLK# Differential Clock Signals**

## 7.10 General AC and DC Characteristics

Table 12 shows the AMD Sempron processor model 10 AC and DC characteristics of the Southbridge, JTAG, test, and miscellaneous pins.

**Table 12. General AC and DC Characteristics**

Symbol	Parameter Description	Condition	Min	Max	Units	Notes
$V_{IH}$	Input High Voltage		$(V_{CC\_CORE} / 2) + 200 \text{ mV}$	$V_{CC\_CORE} + 300 \text{ mV}$	V	1, 2
$V_{IL}$	Input Low Voltage		-300	350	mV	1, 2
$V_{OH}$	Output High Voltage		$V_{CC\_CORE} - 400$	$V_{CC\_CORE} + 300$	mV	
$V_{OL}$	Output Low Voltage		-300	400	mV	
$I_{LEAK\_P}$	Tristate Leakage Pullup	$V_{IN} = V_{SS}$ (Ground)	-1		mA	
$I_{LEAK\_N}$	Tristate Leakage Pulldown	$V_{IN} = V_{CC\_CORE}$ Nominal		600	$\mu\text{A}$	
$I_{OH}$	Output High Current			-6	mA	3
$I_{OL}$	Output Low Current		6		mA	3

**Notes:**

1. Characterized across DC supply voltage range.
2. Values specified at nominal  $V_{CC\_CORE}$ . Scale parameters between  $V_{CC\_CORE}$  minimum and  $V_{CC\_CORE}$  maximum.
3.  $I_{OL}$  and  $I_{OH}$  are measured at  $V_{OL}$  maximum and  $V_{OH}$  minimum, respectively.
4. Synchronous inputs/outputs are specified with respect to RSTCLK and RSTCK# at the pins.
5. These are aggregate numbers.
6. Edge rates indicate the range over which inputs were characterized.
7. In asynchronous operation, the signal must persist for this time to enable capture.
8. This value assumes RSTCLK period is 10 ns  $\Rightarrow T_{BIT} = 2 * f_{RST}$ .
9. The approximate value for standard case in normal mode operation.
10. This value is dependent on RSTCLK frequency, divisors, Low Power mode, and core frequency.
11. Reassertions of the signal within this time are not guaranteed to be seen by the core.
12. This value assumes that the skew between RSTCLK and K7CLKOUT is much less than one phase.
13. This value assumes RSTCLK and K7CLKOUT are running at the same frequency, though the processor is capable of other configurations.
14. Time to valid is for any open-drain pins. See requirements 7 and 8 in the "Power-Up Timing Requirements" chapter for more information.

**Table 12. General AC and DC Characteristics (continued)**

Symbol	Parameter Description	Condition	Min	Max	Units	Notes
$T_{SU}$	Sync Input Setup Time		2.0		ns	4, 5
$T_{HD}$	Sync Input Hold Time		0.0		ps	4, 5
$T_{DELAY}$	Output Delay with respect to RSTCLK		0.0	6.1	ns	5
$T_{BIT}$	Input Time to Acquire		20.0		ns	7, 8
$T_{RPT}$	Input Time to Reacquire		40.0		ns	9-13
$T_{RISE}$	Signal Rise Time		1.0	3.0	V/ns	6
$T_{FALL}$	Signal Fall Time		1.0	3.0	V/ns	6
$C_{PIN}$	Pin Capacitance		4	12	pF	
$T_{VALID}$	Time to data valid			100	ns	14

**Notes:**

1. Characterized across DC supply voltage range.
2. Values specified at nominal  $V_{CC\_CORE}$ . Scale parameters between  $V_{CC\_CORE}$  minimum and  $V_{CC\_CORE}$  maximum.
3.  $I_{OL}$  and  $I_{OH}$  are measured at  $V_{OL}$  maximum and  $V_{OH}$  minimum, respectively.
4. Synchronous inputs/outputs are specified with respect to RSTCLK and RSTCK# at the pins.
5. These are aggregate numbers.
6. Edge rates indicate the range over which inputs were characterized.
7. In asynchronous operation, the signal must persist for this time to enable capture.
8. This value assumes RSTCLK period is 10 ns  $\Rightarrow T_{BIT} = 2*f_{RST}$ .
9. The approximate value for standard case in normal mode operation.
10. This value is dependent on RSTCLK frequency, divisors, Low Power mode, and core frequency.
11. Reassertions of the signal within this time are not guaranteed to be seen by the core.
12. This value assumes that the skew between RSTCLK and K7CLKOUT is much less than one phase.
13. This value assumes RSTCLK and K7CLKOUT are running at the same frequency, though the processor is capable of other configurations.
14. Time to valid is for any open-drain pins. See requirements 7 and 8 in the "Power-Up Timing Requirements" chapter for more information.

## 7.11 Open Drain Test Circuit

Figure 11 is a test circuit that may be used on automated test equipment (ATE) to test for validity on open-drain pins.

Refer to Table 12, “General AC and DC Characteristics,” on page 32 for timing requirements.

Notes:

1.  $V_{\text{Termination}} = 1.2 \text{ V}$  for VID and FID pins  
 $V_{\text{Termination}} = 1.0 \text{ V}$  for APIC pins
2.  $I_{\text{OL}} = -6 \text{ mA}$  for VID and FID pins  
 $I_{\text{OL}} = -9 \text{ mA}$  for APIC pins

**Figure 11. General ATE Open-Drain Test Circuit**

## 7.12 Thermal Diode Characteristics

The AMD Sempron processor model 10 provides a diode that can be used in conjunction with an external temperature sensor to determine the die temperature of the processor. The diode anode (THERMDA) and cathode (THERMDC) are available as pins on the processor, as described in “THERMDA and THERMDC Pins” on page 73.

For information about thermal design for the AMD Sempron processor model 10, including layout and airflow considerations, see the *AMD Processor Thermal, Mechanical, and Chassis Cooling Design Guide*, order# 23794, and the cooling guidelines on <http://www.amd.com>.

### Thermal Diode Electrical Characteristics

Table 13 shows the AMD Sempron processor model 10 characteristics of the on-die thermal diode. For information about calculations for the ideal diode equation and temperature offset correction, see Appendix A, "Thermal Diode Calculations," on page 77.

**Table 13. Thermal Diode Electrical Characteristics**

Symbol	Parameter Description	Min	Nom	Max	Units	Notes
I	Sourcing current	5		300	µA	1
$n_f$ , lumped	Lumped ideality factor	1.00000	1.00374	1.00900		2, 3, 4
$n_f$ , actual	Actual ideality factor		1.00261			3, 4
$R_T$	Series Resistance		0.93		Ω	3, 4

**Notes:**

1. The sourcing current should always be used in forward bias only.
2. Characterized at 95°C with a forward bias current pair of 10 µA and 100 µA. AMD recommends using a minimum of two sourcing currents to accurately measure the temperature of the thermal diode.
3. Not 100% tested. Specified by design and limited characterization.
4. The lumped ideality factor adds the effect of the series resistance term to the actual ideality factor. The series resistance term indicates the resistance from the pins of the processor to the on-die thermal diode. The value of the lumped ideality factor depends on the sourcing current pair used.

**Thermal Protection Characterization**

The following section describes parameters relating to thermal protection. The implementation of thermal control circuitry to control processor temperature is left to the manufacturer to determine how to implement.

Thermal limits in motherboard design are necessary to protect the processor from thermal damage.  $T_{SHUTDOWN}$  is the temperature for thermal protection circuitry to initiate shutdown of the processor.  $T_{SD\_DELAY}$  is the maximum time allowed from the detection of the over-temperature condition to processor shutdown to prevent thermal damage to the processor.

Systems that do not implement thermal protection circuitry or that do not react within the time specified by  $T_{SD\_DELAY}$  can cause thermal damage to the processor during the unlikely events of fan failure or powering up the processor without a heat-sink. The processor relies on thermal circuitry on the motherboard to turn off the regulated core voltage to the processor in response to a thermal shutdown event.

Thermal protection circuitry reference designs and thermal solution guidelines are found in the following documents:

*AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363

*AMD Thermal, Mechanical, and Chassis Cooling Design Guide*, order# 23794

See <http://www.amd.com> for more information about thermal solutions.

Table 14 shows the  $T_{SHUTDOWN}$  and  $T_{SD\_DELAY}$  specifications for circuitry in motherboard design necessary for thermal protection of the processor.

**Table 14. Guidelines for Platform Thermal Protection of the Processor**

Symbol	Parameter Description	Max	Units	Notes
$T_{SHUTDOWN}$	Thermal diode shutdown temperature for processor protection	125	°C	1, 2, 3
$T_{SD\_DELAY}$	Maximum allowed time from $T_{SHUTDOWN}$ detection to processor shutdown	500	ms	1, 3

**Notes:**

1. The thermal diode is not 100% tested, it is specified by design and limited characterization.
2. The thermal diode is capable of responding to thermal events of 40°C/s or faster.
3. The AMD Sempron™ processor model 10 provides a thermal diode for measuring die temperature of the processor. The processor relies on thermal circuitry on the motherboard to turn off the regulated core voltage to the processor in response to a thermal shutdown event. Refer to AMD Athlon™ Processor-Based Motherboard Design Guide, order# 24363, for thermal protection circuitry designs.

## 7.13 APIC Pins AC and DC Characteristics

Table 15 shows the AMD Sempron processor model 10 AC and DC characteristics of the APIC pins.

**Table 15. APIC Pin AC and DC Characteristics**

Symbol	Parameter Description	Condition	Min	Max	Units	Notes
$V_{IH}$	Input High Voltage		1.7	2.625	V	1, 2
		$V_{CC\_CORE} < V_{CC\_CORE\_MAX}$		$ V_{IH} - V_{CC\_CORE}  \leq 1.60$ V	V	3
$V_{IL}$	Input Low Voltage		-300	700	mV	1
$V_{OH}$	Output High Voltage			2.625	V	2
		$V_{CC\_CORE} < V_{CC\_CORE\_MAX}$		$ V_{OH} - V_{CC\_CORE}  \leq 1.60$ V	V	3
$V_{OL}$	Output Low Voltage		-300	400	mV	
$I_{LEAK\_P}$	Tristate Leakage Pullup	$V_{IN} = VSS$ (Ground)	-1		mA	
$I_{LEAK\_N}$	Tristate Leakage Pulldown	$V_{IN} = 2.5$ V		1	mA	
$I_{OL}$	Output Low Current	$V_{OL}$ Max	9		mA	

**Notes:**

1. Characterized across DC supply voltage range.
2. The 2.625-V value is equal to 2.5 V plus a maximum of five percent.
3. Refer to "VCC\_2.5V Generation Circuit" found in the section, "Motherboard Required Circuits," of the AMD Athlon™ Processor-Based Motherboard Design Guide, order# 24363.
4. Edge rates indicate the range for characterizing the inputs.

**Table 15. APIC Pin AC and DC Characteristics (continued)**

Symbol	Parameter Description	Condition	Min	Max	Units	Notes
$T_{RISE}$	Signal Rise Time		1.0	3.0	V/ns	3
$T_{FALL}$	Signal Fall Time		1.0	3.0	V/ns	3
$T_{SU}$	Setup Time		1		ns	
$T_{HD}$	Hold Time		1		ns	
$C_{PIN}$	Pin Capacitance		4	12	pF	

**Notes:**

1. Characterized across DC supply voltage range.
2. The 2.625-V value is equal to 2.5 V plus a maximum of five percent.
3. Refer to "VCC\_2.5V Generation Circuit" found in the section, "Motherboard Required Circuits," of the AMD Athlon™ Processor-Based Motherboard Design Guide, order# 24363.
4. Edge rates indicate the range for characterizing the inputs.

**8****Signal and Power-Up Requirements**

The AMD Sempron™ processor model 10 is designed to provide functional operation if the voltage and temperature parameters are within the limits of normal operating ranges.

**8.1 Power-Up Requirements****Signal Sequence and Timing Description**

Figure 12 shows the relationship between key signals in the system during a power-up sequence. This figure details the requirements of the processor.

**Figure 12. Signal Relationship Requirements During Power-Up Sequence**

**Notes:**

1. Figure 12 represents several signals generically by using names not necessarily consistent with any pin lists or schematics.
2. Requirements 1–8 in Figure 12 are described in “Power-Up Timing Requirements” on page 40.

**Power-Up Timing Requirements.** The signal timing requirements are as follows:

1. RESET# must be asserted before PWROK is asserted.

The AMD Sempron processor model 10 does not set the correct clock multiplier if PWROK is asserted prior to a RESET# assertion. It is recommended that RESET# be asserted at least 10 nanoseconds prior to the assertion of PWROK.

In practice, a Southbridge asserts RESET# milliseconds before PWROK is asserted.

2. All motherboard voltage planes must be within specification before PWROK is asserted.

PWROK is an output of the voltage regulation circuit on the motherboard. PWROK indicates that  $V_{CC\_CORE}$  and all other voltage planes in the system are within specification.

The motherboard is required to delay PWROK assertion for a minimum of three milliseconds from the 3.3 V supply being within specification. This delay ensures that the system clock (SYSCLK/SYSCLK#) is operating within specification when PWROK is asserted.

The processor core voltage,  $V_{CC\_CORE}$ , must be within specification as dictated by the VID[4:0] pins driven by the processor before PWROK is asserted. Before PWROK assertion, the AMD Sempron processor is clocked by a ring oscillator.

The processor PLL is powered by VCCA. The processor PLL does not lock if VCCA is not high enough for the processor logic to switch for some period before PWROK is asserted. VCCA must be within specification at least five microseconds before PWROK is asserted.

In practice VCCA,  $V_{CC\_CORE}$ , and all other voltage planes must be within specification for several milliseconds before PWROK is asserted.

After PWROK is asserted, the processor PLL locks to its operational frequency.

3. The system clock (SYSCLK/SYSCLK#) must be running before PWROK is asserted.

When PWROK is asserted, the processor switches from driving the internal processor clock grid from the ring oscillator to driving from the PLL. The reference system

clock must be valid at this time. The system clocks are designed to be running after 3.3 V has been within specification for three milliseconds.

#### 4. PWROK assertion to deassertion of RESET#

The duration of RESET# assertion during cold boots is intended to satisfy the time it takes for the PLL to lock with a less than 1 ns phase error. The processor PLL begins to run after PWROK is asserted and the internal clock grid is switched from the ring oscillator to the PLL. The PLL lock time may take from hundreds of nanoseconds to tens of microseconds. It is recommended that the minimum time between PWROK assertion to the deassertion of RESET# be at least **1.0 milliseconds**. Southbridges enforce a delay of 1.5 to 2.0 milliseconds between PWRGD (Southbridge version of PWROK) assertion and NB\_RESET# deassertion.

5. PWROK must be monotonic and meet the timing requirements as defined in Table 12, “General AC and DC Characteristics,” on page 32. The processor should not switch between the ring oscillator and the PLL after the initial assertion of PWROK.
6. NB\_RESET# must be asserted (causing CONNECT to also assert) before RESET# is deasserted. In practice all Southbridges enforce this requirement.

If NB\_RESET# does not assert until after RESET# has deasserted, the processor misinterprets the CONNECT assertion (due to NB\_RESET# being asserted) as the beginning of the SIP transfer. There must be sufficient overlap in the resets to ensure that CONNECT is sampled asserted by the processor before RESET# is deasserted.

7. The FID[3:0] signals are valid within 100 ns after PWROK is asserted. The chipset must not sample the FID[3:0] signals until they become valid. Refer to the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, for the specific implementation and additional circuitry required.
8. The FID[3:0] signals become valid within 100 ns after RESET# is asserted. Refer to the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, for the specific implementation and additional circuitry required.

**Clock Multiplier  
Selection (FID[3:0])**

The chipset samples the FID[3:0] signals in a chipset-specific manner from the processor and uses this information to determine the correct serial initialization packet (SIP). The chipset then sends the SIP information to the processor for configuration of the AMD Athlon system bus for the clock multiplier that determines the processor frequency indicated by the FID[3:0] code. The SIP is sent to the processor using the SIP protocol. This protocol uses the PROCRDY, CONNECT, and CLKFWDRST signals, that are synchronous to SYSCLK.

For more information about FID[3:0], see “FID[3:0] Pins” on page 70.

**Serial Initialization Packet (SIP) Protocol.** Refer to *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902 for details of the SIP protocol.

## **8.2 Processor Warm Reset Requirements**

**Northbridge Reset  
Pins**

RESET# cannot be asserted to the processor without also being asserted to the Northbridge. RESET# to the Northbridge is the same as PCI RESET#. The minimum assertion for PCI RESET# is one millisecond. Southbridges enforce a minimum assertion of RESET# for the processor, Northbridge, and PCI of 1.5 to 2.0 milliseconds.

## 9 Mechanical Data

The AMD Sempron™ processor model 10 connects to the motherboard through a Pin Grid Array (PGA) socket named Socket A. This processor utilizes the Organic Pin Grid Array (OPGA) package type described in this chapter. For more information, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

### 9.1 Die Loading

The processor die on the OPGA package is exposed at the top of the package. This feature facilitates heat transfer from the die to an approved heat sink. Any heat sink design should avoid loads on corners and edges of die. The OPGA package has compliant pads that serve to bring surfaces in planar contact. Tool-assisted zero insertion force sockets should be designed so that no load is placed on the ceramic substrate of the package.

Table 16 shows the mechanical loading specifications for the processor die. It is critical that the mechanical loading of the heat sink does not exceed the limits shown in Table 16.

**Table 16. Mechanical Loading**

Location	Dynamic (MAX)	Static (MAX)	Units	Note
Die Surface	100	30	lbf	1
Die Edge	10	10	lbf	2

**Notes:**

1. Load specified for coplanar contact to die surface.
2. Load defined for a surface at no more than a two-degree angle of inclination to die surface.

## 9.2

## AMD Sempron™ Processor Model 10 Part Number 27488 OPGA Package Dimensions

Table 17 shows the part number 27488 OPGA package dimensions in millimeters assigned to the letters and symbols used in the 27488 package diagram, Figure 13 on page 45.

**Table 17. Dimensions for the AMD Sempron™ Processor Model 10 Part Number 27488 OPGA Package**

Letter or Symbol	Minimum Dimension <sup>1</sup>	Maximum Dimension <sup>1</sup>	Letter or Symbol	Minimum Dimension <sup>1</sup>	Maximum Dimension <sup>1</sup>

E8	13.28	13.83	Mass <sup>2</sup>	11.0 g REF	

**Note:**

1. Dimensions are given in millimeters.
2. The mass consists of the completed package, including processor, surface mounted parts and pins.

#### GENERAL NOTES

1. All dimensions are specified in millimeters (mm).
2. Dimensioning and tolerancing per ASME-Y14.5M-1994.
3. This corner is marked with a triangle on both sides of the package to identify the pin A1 corner for orientation purposes.
4. Symbol "M" determines pin matrix size and "N" is number of pins.
5. Dimension "b" is measured at maximum solder pin diameter on a plane parallel to datum C.

**Figure 13. AMD Sempron™ Processor Model 10 Part Number 27488 OPGA Package Diagram**

## 9.3

## AMD Sempron™ Processor Model 10 Part Number 27493 OPGA Package Dimensions

Table 18 shows the part number 27493 OPGA package dimensions in millimeters assigned to the letters and symbols shown in the 27493 package diagram, Figure 14 on page 47.

## 10 Pin Descriptions

---

This chapter includes pin diagrams of the organic pin grid array (OPGA) for the AMD Sempron™ processor model 10, a listing of pin name abbreviations, and a cross-referenced listing of pin locations to signal names.

### 10.1 Pin Diagram and Pin Name Abbreviations

Figure 15 on page 50 shows the staggered Pin Grid Array (PGA) for the AMD Sempron™ processor model 10. Because some of the pin names are too long to fit in the grid, they are abbreviated. Figure 16 on page 51 shows the bottomside view of the array. Table 19 on page 52 lists all the pins in alphabetical order by pin name, along with the abbreviation where necessary.

## 10.2 Pin List

Table 20 on page 60 cross-references Socket A pin location to signal name.

The “L” (Level) column shows the electrical specification for this pin. “P” indicates a push-pull mode driven by a single source. “O” indicates open-drain mode that allows devices to share the pin.

**Note:** *The AMD Sempron processor supports push-pull drivers. For more information, see “Push-Pull (PP) Drivers” on page 6.*

The “P” (Port) column indicates if this signal is an input (I), output (O), or bidirectional (B) signal. The “R” (Reference) column indicates if this signal should be referenced to VSS (G) or VCC\_CORE (P) planes for the purpose of signal routing with respect to the current return paths.

**Table 20. Cross-Reference by Pin Location**

## 10.3 Detailed Pin Descriptions

The information in this section pertains to Table 20 on page 60.

### A20M# Pin

A20M# is an input from the system used to simulate address wrap-around in the 20-bit 8086.

### AMD Pin

AMD Socket A processors do not implement a pin at location AH6. All Socket A designs must have a top plate or cover that blocks this pin location. When the cover plate blocks this location, a non-AMD part (e.g., PGA370) does not fit into the socket. However, socket manufacturers are allowed to have a contact loaded in the AH6 position. Therefore, motherboard socket design should account for the possibility that a contact could be loaded in this position.

### AMD Athlon™ System Bus Pins

See the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902 for information about the system bus pins—PROCRDY, PWROK, RESET#, SADDIN[14:2]#, SADDINCLK#, SADDOOUT[14:2]#, SADDOOUTCLK#, SDATA[63:0]#, SDATAINCLK[3:0]#, SDATAINVALID#, SDATAOUTCLK[3:0]#, SDATAOUTVALID#, SFILLVALID#.

### Analog Pin

Treat this pin as a NC.

### APIC Pins, PICCLK, PICD[1:0]#

The Advanced Programmable Interrupt Controller (APIC) is a feature that provides a flexible and expandable means of delivering interrupts in a system using an AMD processor. The pins, PICD[1:0], are the bidirectional message-passing signals used for the APIC and are driven to the Southbridge or a dedicated I/O APIC. The pin, PICCLK, must be driven with a valid clock input.

Refer to “VCC\_2.5V Generation Circuit” found in the section, “Motherboard Required Circuits,” of the *AMD Athlon™ Processor Motherboard Design Guide*, order# 24363 for the required supporting circuitry.

For more information, see Table 15, “APIC Pin AC and DC Characteristics,” on page 37.

### CLKFWDRST Pin

CLKFWDRST resets clock-forward circuitry for both the system and processor.

**CLKIN, RSTCLK  
(SYSCLK) Pins**

Connect CLKIN with RSTCLK and name it SYSCLK. Connect CLKIN# with RSTCLK# and name it SYSCLK#. Length match the clocks from the clock generator to the Northbridge and processor.

See “SYSCLK and SYSCLK#” on page 73 for more information.

**CONNECT Pin**

CONNECT is an input from the system used for power management and clock-forward initialization at reset.

**COREFB and  
COREFB# Pins**

COREFB and COREFB# are outputs to the system that provide processor core voltage feedback to the system.

**CPU\_PRESENCE# Pin**

CPU\_PRESENCE# is connected to VSS on the processor package. If pulled-up on the motherboard, CPU\_PRESENCE# may be used to detect the presence or absence of a processor in the Socket A-style socket.

**DBRDY and DBREQ#  
Pins**

DBRDY and DBREQ# are routed to the debug connector. DBREQ# is tied to V<sub>CC\_CORE</sub> with a pullup resistor.

**FERR Pin**

FERR is an output to the system that is asserted for any unmasked numerical exception independent of the NE bit in CR0. FERR is a push-pull active High signal that must be inverted and level shifted to an active Low signal. For more information about FERR and FERR#, see the “Required Circuits” chapter of the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

**FID[3:0] Pins**

FID[3] (Y3), FID[2] (Y1), FID[1] (W3), and FID[0] (W1) are the 4-bit processor clock-to-SYCLK ratio.

Table 21 describes the encodings of the clock multipliers on FID[3:0].

**Table 21. FID[3:0] Clock Multiplier Encodings**

FID[3:0] <sup>2</sup>	Processor Clock to SYCLK Frequency Ratio
0000	11
0001	11.5
0010	12
0011	≥ 12.5 <sup>1</sup>
0100	5
0101	5.5
0110	6
0111	6.5
1000	7
1001	7.5
1010	8
1011	8.5
1100	9
1101	9.5
1110	10
1111	10.5

**Notes:**

1. All ratios greater than or equal to 12.5x have the same FID[3:0] code of 0011b, which causes the SIP configuration for all ratios of 12.5x or greater to be the same.
2. BIOS initializes the CLK\_Ctl MSR during the POST routine. This CLK\_Ctl setting is used with all FID combinations and selects a Halt disconnect divisor and a Stop Grant disconnect divisor. For more information, refer to the AMD Athlon™ and AMD Duron™ Processors BIOS, Software, and Debug Developers Guide, order# 21656.

The FID[3:0] signals are open-drain processor outputs that are pulled High on the motherboard and sampled by the chipset to determine the SIP (serial initialization packet) that is sent to the processor. The FID[3:0] signals are valid after PWROK is asserted. The FID[3:0] signals must not be sampled until they become valid. See the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902 for more information about Serialization Initialization Packets and SIP protocol.

The processor FID[3:0] outputs are open-drain and 2.5-V tolerant. To prevent damage to the processor, do not pull these

signals High above 2.5 V. Do not expose these pins to a differential voltage greater than 1.60 V, relative to the processor core voltage.

Refer to “VCC\_2.5V Generation Circuit” found in the section, “Motherboard Required Circuits,” of the *AMD Athlon™ Processor Motherboard Design Guide*, order# 24363 for the required supporting circuitry.

See “Frequency Identification (FID[3:0])” on page 27 for the DC characteristics for FID[3:0].

#### **FSB\_Sense[1:0] Pins**

FSB\_Sense[1:0] pins are either open circuit (logic level of 1) or are pulled to ground (logic level of 0) on the processor package with a 1 kΩ resistor. In conjunction with a circuit on the motherboard, these pins may be used to automatically detect the front-side bus (FSB) setting of this processor. Proper detection of the FSB setting requires the implementation of a pull-up resistor on the motherboard. Refer to the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363 and the technical note *FSB\_Sense Auto Detection Circuitry for Desktop Processors*, order# TN26673 for more information.

Table 22 is the truth table to determine the FSB of desktop processors.

**Table 22. Front-Side Bus Sense Truth Table**

FSB_Sense[1]	FSB_Sense[0]	Bus Frequency
1	0	RESERVED
1	1	133 MHz
0	1	166 MHz
0	0	200 MHz

The FSB\_Sense[1:0] pins are 3.3-V tolerant.

#### **FLUSH# Pin**

FLUSH# must be tied to V<sub>CC\_CORE</sub> with a pullup resistor. If a debug connector is implemented, FLUSH# is routed to the debug connector.

#### **IGNNE# Pin**

IGNNE# is an input from the system that tells the processor to ignore numeric errors.

#### **INIT# Pin**

INIT# is an input from the system that resets the integer registers without affecting the floating-point registers or the internal caches. Execution starts at 0\_FFFF\_FFF0h.

**INTR Pin**

INTR is an input from the system that causes the processor to start an interrupt acknowledge transaction that fetches the 8-bit interrupt vector and starts execution at that location.

**JTAG Pins**

TCK, TMS, TDI, TRST#, and TDO are the JTAG interface. Connect these pins directly to the motherboard debug connector. Pull TDI, TCK, TMS, and TRST# up to  $V_{CC\_CORE}$  with pullup resistors.

**K7CLKOUT and K7CLKOUT# Pins**

K7CLKOUT and K7CLKOUT# are each run for two to three inches and then terminated with a resistor pair: 100 ohms to  $V_{CC\_CORE}$  and 100 ohms to VSS. The effective termination resistance and voltage are 50 ohms and  $V_{CC\_CORE}/2$ .

**Key Pins**

These 16 locations are for processor type keying for forwards and backwards compatibility (G7, G9, G15, G17, G23, G25, N7, Q7, Y7, AA7, AG7, AG9, AG15, AG17, AG27, and AG29). Motherboard designers should treat key pins like NC (No Connect) pins. A socket designer has the option of creating a top mold piece that allows PGA key pins only where designated. However, sockets that populate all 16 key pins must be allowed, so the motherboard must always provide for pins at all key pin locations.

See “NC Pins” for more information.

**NC Pins**

The motherboard should provide a plated hole for an NC pin. The pin hole should not be electrically connected to anything.

**NMI Pin**

NMI is an input from the system that causes a non-maskable interrupt.

**PGA Orientation Pins**

No pin is present at pin locations A1 and AN1. Motherboard designers should not allow for a PGA socket pin at these locations.

For more information, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

**PLL Bypass and Test Pins**

PLLTEST#, PLLBYPASS#, PLLMON1, PLLMON2, PLLBYPASSCLK, and PLLBYPASSCLK# are the PLL bypass and test interface. This interface is tied disabled on the motherboard. All six pin signals are routed to the debug connector. All four processor inputs (PLLTEST#, PLLBYPASS#, PLLMON1, and PLLMON2) are tied to  $V_{CC\_CORE}$  with pullup resistors.

**PWROK Pin**

The PWROK input to the processor must not be asserted until all voltage planes in the system are within specification and all system clocks are running within specification.

For more information, Chapter 8, “Signal and Power-Up Requirements” on page 39.

**SADDIN[1:0]# and SADDOOUT[1:0]# Pins**

The AMD Sempron processor model 10 does not support SADDIN[1:0]# or SADDOOUT[1:0]#. SADDIN[1]# is tied to VCC with pullup resistors, if this bit is not supported by the Northbridge (future models can support SADDIN[1]#). SADDOOUT[1:0]# are tied to VCC with pullup resistors if these pins are supported by the Northbridge. For more information, see the *AMD Athlon™ and AMD Duron™ System Bus Specification*, order# 21902.

**Scan Pins**

SCANSHIFTEN, SCANCLK1, SCANINTEVAL, and SCANCLK2 are the scan interface. This interface is AMD internal and is tied disabled with pulldown resistors to ground on the motherboard.

**SMI# Pin**

SMI# is an input that causes the processor to enter the system management mode.

**STPCLK# Pin**

STPCLK# is an input that causes the processor to enter a lower power mode and issue a Stop Grant special cycle.

**SYSCLK and SYSCLK#**

SYSCLK and SYSCLK# are differential input clock signals provided to the PLL of the processor from a system-clock generator.

See “CLKIN, RSTCLK (SYSCLK) Pins” on page 69 for more information.

**THERMDA and THERMDC Pins**

Thermal Diode anode and cathode pins are used to monitor the actual temperature of the processor die, providing more accurate temperature control to the system.

See Table 13, “Thermal Diode Electrical Characteristics,” on page 35 for more information.

**VCCA Pin**

VCCA is the processor PLL supply. For information about the VCCA pin, see Table 5, “VCCA AC and DC Characteristics,” on page 35 and the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

To prevent damage to the processor, do not pull this signal High above 2.5 V. Do not expose this pin to a differential voltage greater than 1.60 V, relative to the processor core voltage.

**VID[4:0] Pins**

The VID[4:0] (Voltage Identification) outputs are used to dictate the  $V_{CC\_CORE}$  voltage level. The VID[4:0] pins are strapped to ground or left unconnected on the processor package. The VID[4:0] pins are pulled up on the motherboard and used by the  $V_{CC\_CORE}$  DC/DC converter.

The VID codes and corresponding voltage levels are shown in Table 23.

**Table 23. VID[4:0] Code to Voltage Definition**

VID[4:0]	$V_{CC\_CORE}$ (V)	VID[4:0]	$V_{CC\_CORE}$ (V)
00000	1.850	10000	1.450
00001	1.825	10001	1.425
00010	1.800	10010	1.400
00011	1.775	10011	1.375
00100	1.750	10100	1.350
00101	1.725	10101	1.325
00111	1.675	10111	1.275
01000	1.650	11000	1.250
01001	1.625	11001	1.225
01010	1.600	11010	1.200
01011	1.575	11011	1.175
01100	1.550	11100	1.150
01101	1.525	11101	1.125
01110	1.500	11110	1.100
01111	1.475	11111	No CPU

For more information, see the “Required Circuits” chapter of the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

**VREFSYS Pin**

VREFSYS (W5) drives the threshold voltage for the system bus input receivers. The value of VREFSYS is system specific. In addition, to minimize  $V_{CC\_CORE}$  noise rejection from VREFSYS, include decoupling capacitors. For more information, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

**ZN and ZP Pins**

ZN (AC5) and ZP (AE5) are the push-pull compensation circuit pins. In Push-Pull mode (selected by the SIP parameter SysPushPull asserted), ZN is tied to V<sub>CC\_CORE</sub> with a resistor that has a resistance matching the impedance  $Z_0$  of the transmission line. ZP is tied to VSS with a resistor that has a resistance matching the impedance  $Z_0$  of the transmission line.

## 11 Ordering Information

### Standard AMD Sempron™ Processor Model 10 Products

AMD standard products are available in several operating ranges. The ordering part numbers (OPN) are formed by a combination of the elements, as shown in Figure 17.

**Note:**

1. Spaces are added to the number shown above for viewing clarity only.
2. This processor is available only with an advanced 333 FSB.

**Figure 17. OPN Example for the AMD Sempron™ Processor Model 10 with 256K L2 Cache**

## Thermal Diode Calculations

---

This section contains information about the calculations for the on-die thermal diode of the AMD Sempron™ processor model 10. For electrical information about this thermal diode, see Table 13, “Thermal Diode Electrical Characteristics,” on page 35.

### Ideal Diode Equation

The ideal diode equation uses the variables and constants defined in Table 24.

**Table 24. Constants and Variables for the Ideal Diode Equation**

Equation Symbol	Variable, Constant Description
$n_f$ , lumped	Lumped ideality factor
$k$	Boltzmann constant
$q$	Electron charge constant
$T$	Diode temperature (Kelvin)
$V_{BE}$	Voltage from base to emitter
$I_C$	Collector current
$I_S$	Saturation current

Equation (1) shows the ideal diode calculation.

$$V_{BE} = n_{f, \text{lumped}} \cdot \frac{k}{q} \cdot T \cdot \ln\left(\frac{I_C}{I_S}\right) \quad (1)$$

Sourcing two currents and using Equation (1) derives the difference in the base-to-emitter voltage that leads to finding the diode temperature as shown in Equation (2). The use of dual sourcing currents allows the measurement of the thermal diode temperature to be more accurate and less susceptible to die and process revisions. Temperature sensors that utilize series resistance cancellation can use more than two sourcing currents and are suitable to be used with the AMD thermal diode. Equation (2) is the formula for calculating the temperature of a thermal diode.

$$T = \frac{V_{BE, \text{high}} - V_{BE, \text{low}}}{n_{f, \text{lumped}} \cdot \frac{k}{q} \cdot \ln\left(\frac{I_{\text{high}}}{I_{\text{low}}}\right)} \quad (2)$$

## Temperature Offset Correction

A temperature offset may be required to correct the value measured by a temperature sensor. An offset is necessary if a difference exists between the lumped ideality factor of the processor and the ideality factor assumed by the temperature sensor. The lumped ideality factor can be calculated using the equations in this section to find the temperature offset that should be used with the temperature sensor.

Table 25 shows the constants and variables used to calculate the temperature offset correction.

**Table 25. Constants and Variables Used in Temperature Offset Equations**

Equation Symbol	Variable, Constant Description
$n_f, \text{actual}$	Actual ideality factor
$n_f, \text{lumped}$	Lumped ideality factor
$n_f, \text{TS}$	Ideality factor assumed by temperature sensor
$I_{\text{high}}$	High sourcing current
$I_{\text{low}}$	Low sourcing current
$T_{\text{die, spec}}$	Die temperature specification
$T_{\text{offset}}$	Temperature offset

The formulas in Equation (3) and Equation (4) can be used to calculate the temperature offset for temperature sensors that do not employ series resistance cancellation. The result is added to the value measured by the temperature sensor. Contact the vendor of the temperature sensor being used for the value of  $n_{f,TS}$ . Refer to the document, *On-Die Thermal Diode Characterization*, order# 25443, for further details.

Equation (3) shows the equation for calculating the lumped ideality factor ( $n_{f, \text{lumped}}$ ) in sensors that do not employ series resistance cancellation.

$$n_{f, \text{lumped}} = n_{f, \text{actual}} + \frac{R_T \cdot (I_{\text{high}} - I_{\text{low}})}{\frac{k}{q} (T_{\text{die, spec}} + 273.15) \cdot \ln\left(\frac{I_{\text{high}}}{I_{\text{low}}}\right)} \quad (3)$$

Equation (4) shows the equation for calculating temperature offset ( $T_{\text{offset}}$ ) in sensors that do not employ series resistance cancellation.

$$T_{\text{offset}} = (T_{\text{die, spec}} + 273.15) \cdot \left(1 - \frac{n_{f, \text{lumped}}}{n_{f, TS}}\right) \quad (4)$$

Equation (5) is the temperature offset for temperature sensors that utilize series resistance cancellation. Add the result to the value measured by the temperature sensor. Note that the value of  $n_{f,TS}$  in Equation (5) may not equal the value used in Equation (4).

$$T_{\text{offset}} = (T_{\text{die, spec}} + 273.15) \cdot \left(1 - \frac{n_{f, \text{actual}}}{n_{f, TS}}\right) \quad (5)$$

## Conventions and Abbreviations

---

This section contains information about the conventions and abbreviations used in this document.

### Signals and Bits

- Active-Low Signals—Signal names containing a pound sign, such as SFILL#, indicate active-Low signals. They are asserted in their Low-voltage state and negated in their High-voltage state. When used in this context, High and Low are written with an initial upper case letter.
- Signal Ranges—In a range of signals, the highest and lowest signal numbers are contained in brackets and separated by a colon (for example, D[63:0]).
- Reserved Bits and Signals—Signals or bus bits marked *reserved* must be driven inactive or left unconnected, as indicated in the signal descriptions. These bits and signals are reserved by AMD for future implementations. When software reads registers with reserved bits, the reserved bits must be masked. When software writes such registers, it must first read the register and change only the non-reserved bits before writing back to the register.
- Three-State—In timing diagrams, signal ranges that are high impedance are shown as a straight horizontal line half-way between the high and low levels.
- Invalid and Don't-Care—In timing diagrams, signal ranges that are invalid or don't-care are filled with a screen pattern.

## Data Terminology

The following list defines data terminology:

- Quantities
  - A *word* is two bytes (16 bits)
  - A *doubleword* is four bytes (32 bits)
  - A *quadword* is eight bytes (64 bits)
- Addressing—Memory is addressed as a series of bytes on eight-byte (64-bit) boundaries in which each byte can be separately enabled.
- Abbreviations—The following notation is used for bits and bytes:
  - Kilo (K, as in 4-Kbyte page)
  - Mega (M, as in 4 Mbits/sec)
  - Giga (G, as in 4 Gbytes of memory space)

See Table 26 on page 85 for more abbreviations.
- Little-Endian Convention—The byte with the address xx...xx00 is in the least-significant byte position (little end). In byte diagrams, bit positions are numbered from right to left—the little end is on the right and the big end is on the left. Data structure diagrams in memory show low addresses at the bottom and high addresses at the top. When data items are aligned, bit notation on a 64-bit data bus maps directly to bit notation in 64-bit-wide memory. Because byte addresses increase from right to left, strings appear in reverse order when illustrated.
- Bit Ranges—In text, bit ranges are shown with a dash (for example, bits 9–1). When accompanied by a signal or bus name, the highest and lowest bit numbers are contained in brackets and separated by a colon (for example, AD[31:0]).
- Bit Values—Bits can either be set to 1 or cleared to 0.
- Hexadecimal and Binary Numbers—Unless the context makes interpretation clear, hexadecimal numbers are followed by an h and binary numbers are followed by a b.

## Abbreviations and Acronyms

Table 26 contains the definitions of abbreviations used in this document.

**Table 26. Abbreviations**

Abbreviation	Meaning
A	Ampere
F	Farad
G	Giga-
Gbit	Gigabit
Gbyte	Gigabyte
H	Henry
h	Hexadecimal
K	Kilo-
Kbyte	Kilobyte
M	Mega-
Mbit	Megabit
Mbyte	Megabyte
MHz	Megahertz
m	Milli-
ms	Millisecond
mW	Milliwatt
μ	Micro-
μA	Microampere
μF	Microfarad
μH	Microhenry
μs	Microsecond
μV	Microvolt
n	nano-
nA	nanoampere
nF	nanofarad
nH	nanohenry
ns	nanosecond
ohm	Ohm
p	pico-
pA	picoampere

**Table 26. Abbreviations (continued)**

Abbreviation	Meaning
pF	picofarad
pH	picohenry
ps	picosecond
s	Second
V	Volt
W	Watt

Table 27 contains the definitions of acronyms used in this document.

**Table 27. Acronyms**

Abbreviation	Meaning
ACPI	Advanced Configuration and Power Interface
AGP	Accelerated Graphics Port
APCI	AGP Peripheral Component Interconnect
API	Application Programming Interface
APIC	Advanced Programmable Interrupt Controller
BIOS	Basic Input/Output System
BIST	Built-In Self-Test
BIU	Bus Interface Unit
CPGA	Ceramic Pin Grid Array
DDR	Double-Data Rate
DIMM	Dual Inline Memory Module
DMA	Direct Memory Access
DRAM	Direct Random Access Memory
EIDE	Enhanced Integrated Device Electronics
EISA	Extended Industry Standard Architecture
EPROM	Enhanced Programmable Read Only Memory
FIFO	First In, First Out
GART	Graphics Address Remapping Table
HSTL	High-Speed Transistor Logic
IDE	Integrated Device Electronics
ISA	Industry Standard Architecture
JEDEC	Joint Electron Device Engineering Council
JTAG	Joint Test Action Group

**Table 27. Acronyms (continued)**

Abbreviation	Meaning
LAN	Large Area Network
LRU	Least-Recently Used
LVTL	Low Voltage Transistor Transistor Logic
MSB	Most Significant Bit
MTRR	Memory Type and Range Registers
MUX	Multiplexer
NMI	Non-Maskable Interrupt
OD	Open-Drain
OPGA	Organic Pin Grid Array
PBGA	Plastic Ball Grid Array
PA	Physical Address
PCI	Peripheral Component Interconnect
PDE	Page Directory Entry
PDT	Page Directory Table
PGA	Pin Grid Array
PLL	Phase Locked Loop
PMSM	Power Management State Machine
POS	Power-On Suspend
POST	Power-On Self-Test
RAM	Random Access Memory
ROM	Read Only Memory
RXA	Read Acknowledge Queue
SCSI	Small Computer System Interface
SDI	System DRAM Interface
SDRAM	Synchronous Direct Random Access Memory
SIMD	Single Instruction Multiple Data
SIP	Serial Initialization Packet
SMbus	System Management Bus
SPD	Serial Presence Detect
SRAM	Synchronous Random Access Memory
SROM	Serial Read Only Memory
TLB	Translation Lookaside Buffer
TOM	Top of Memory
TTL	Transistor Transistor Logic

**Table 27. Acronyms (continued)**

<b>Abbreviation</b>	<b>Meaning</b>
VAS	Virtual Address Space
VPA	Virtual Page Address
VGA	Video Graphics Adapter
USB	Universal Serial Bus
ZDB	Zero Delay Buffer
